8/10/2016 9:00-9:15 AM

Star JPSS 2016 Annual Science Team Meeting

*8-12 August 2016, College Park, Maryland*

Key Points

- **Ocean color products are highly sensitive to details in processing algorithms and SDR calibration.**

- VIIRS RSB uncertainty specification is 2%; For ocean color EDR products, the ocean bands (M1-M7) are required to be calibrated with an uncertainty of ~0.1-0.3%.

- We recently discovered the "*Solar diffuser (SD) degradation nonuniformity*", which result in long-term bias in calibration, especially for short wavelength bands

- A hybrid approach properly combining the SD and lunar calibration coefficients restores the accuracy of the calibration coefficients from the non-uniformity issue and other various effects:

    – Lunar calibration provides long-term baseline

    – SD calibration provides smoothness and frequency

- **Every component must itself be accurately characterized!**

    – SDSM calibration/SD calibration; Lunar calibration; Hybrid approach

- Challenges and potential issues
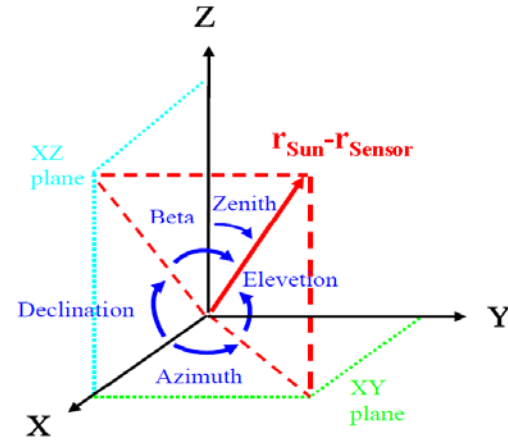

Solar Illumination and Sweet Spot
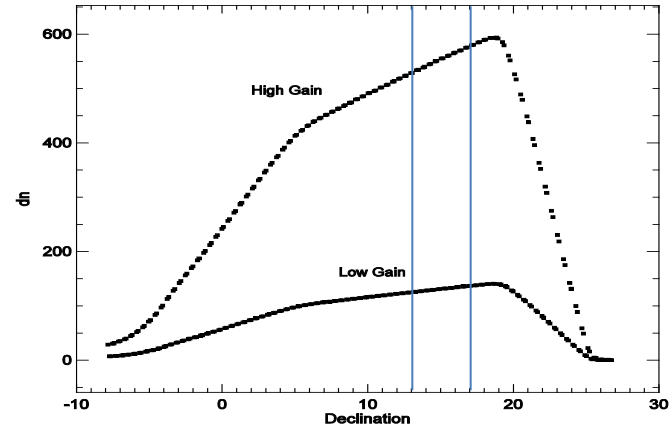

Illumination of SD and SDSM Aperture

SDSM response

Band M1 Detector 1 response

Good selections stabilizes results, reduce noise – Different from ATBD

Prelaunch BRFs of the SD and the VFs of SD and SDSM Screens

The author carefully made yaw planning in 2012 with NASA colleagues for on-orbit validation of BRDF and VF.

We have carefully re-derived BRFs and VFs from the yaw measurements (removes seasonal variation artifacts and noises)

*J. Sun and X. Xiong, "Solar and lunar observation planning for Earth-observing sensor", Proc. SPIE, **8176**, 817610, (2011).*

- SD and SDSM sun view screens:
  - Prevent RSB and SDSM saturation
  - Vignetting functions (VFs)
  - VFs measured prelaunch and validated by yaw measurements
- SD bidirectional reflectance factors (BRFs)
  - BRFs measured prelaunch and validated by yaw measurements
  - SD on-orbit degradation is tracked by the SDSM measurements at 8 wavelength from 412 nm to 935 nm

J. Sun and M. Wang, "On-orbit characterization of the VIIRS solar diffuser and solar diffuser screen," Appl. Opt., 54, 236 -252(2015).

SDSM Calibration Algorithm

- SDSM is a ratio radiometer, which views SD, Sun, and an internal dark scene successively in three-scan cycles.

- SD BRF for SDSM view direction

$$BRF_{SD,SDSM}(\lambda) = \rho_{SD,SDSM}(\lambda)H(\lambda)$$

  - $\rho_{SD,SDSM}(\lambda)$: Prelaunch BRF for SDSM view direction
  - $H(\lambda)$ is solar diffuser degradation since launch

- SD degradation, H factors, for SDSM view direction at the wavelength of the SDSM detector D

$$H(\lambda_D) = \left\langle \frac{dc_{SD,D}}{\rho_{SD,SDSM}(\lambda_D)\tau_{SDS}\cos(\theta_{SD})} \right\rangle_{Scan} \bigg/ \left\langle \frac{dc_{SV,D}}{\tau_{SVS}} \right\rangle_{Scan}$$

- **_Improvements_**
  - _Carefully re-derived the VFs and BRFs from yaw measurements_
  - **_Ratio of the averages (different from ATBD!)_**
 - _Sweet spots selection_

SDSM operations: Every orbit first few months, then once per day for about two years, and once per two days since May, 2014.
J. Sun and M. Wang, "Visible infrared image radiometer suite solar diffuser calibration and its challenges using solar diffuser stability monitor," Appl. Opt., 53, 8571-8584 (2014).

SD view response trending

SD degradation

SD degradation

Unexpected but real degradation (Nov., 2014)

SDSM can accurately track the SD degradation for SDSM direction

SD Calibration Algorithm

- SD is made of Spectralon®, near Lambertian property

- Solar radinace reflected by the SD

$$L_{SD}(\lambda) = I_{Sun}(\lambda) \cdot \tau_{SDS} \cdot \cos(\theta_{SD}) \cdot \rho_{SD,RTA}(\lambda) \cdot h(\lambda) / d_{VS}^2$$

  - $\rho_{RSD,RTA}(\lambda)$: Prelaunch BRF for RTA view direction
  - *h(λ)*: SD degradation for SDSM view direction is used as the SD degradation for the RTA direction

SD Calibration: Every orbit

- RSB calibration coefficients, F factors

$$F(B,D,M,G,t) = \frac{RVS_{B,SD} \cdot \int RSR_B(\lambda,t) \cdot L_{SD}(\lambda) \cdot d\lambda}{\sum_i c_i(B,D,M,G) \cdot dn^i \cdot \int RSR_B(\lambda,t) \cdot d\lambda}$$

  - *B, D, M, G*: Band, Detector, HAM side, and gain status
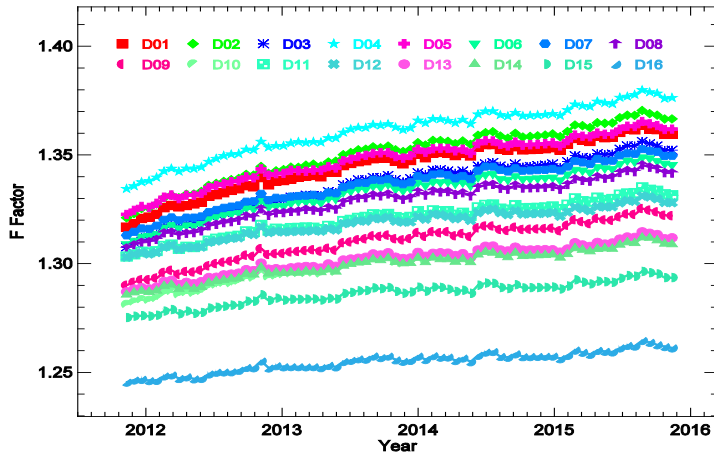

- *Improvements*
  - *Carefully re-derived the VFs and BRFs from yaw measurements*
  - *Improved H-factors*
 - *Sweet spot selection*
  - *Time-dependent RSR*

J. Sun and M. Wang, "On-orbit calibration of Visible Infrared Imaging Radiometer Suite reflective solar bands and its challenges using a solar," Appl. Opt., 54, 7210-7223 (2015).
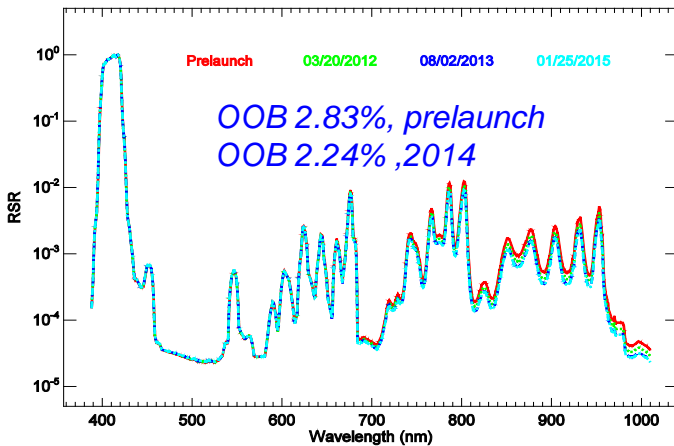

SD Calibration Results

Band M1 HAM 1 HG F-factors

Band Averaged HAM1 HG F-factors

HG = High Gain
LG = Low Gain

Time-dependent RSR

OOB 2.83%, prelaunch
OOB 2.24% ,2014

Impact of RSR on F-factors

SD can accurately track the RSB gain change as long as SD degradation for the RTA view can be approximated as that for the SDSM view.

Lunar Calibration Algorithm

- Moon is very stable in its reflectance

- RSB calibration coefficients , F factors, from lunar observations

$$F(B,M) = \frac{g(B)N_{t,M}}{\sum_{D,S,N} L_{pl}(B,D,S,N)\delta(M,M_N)},$$

- – *g(B)*: View geometric effect correction (ROLO lunar model and extra correction to remove seasonal oscillations)

  SNPP VIIRS is scheduled to view the Moon approximately monthly (about nine months every year)

- *Advantages*
  - *Lunar surface reflectance has no observable degradation*
 - *Can be used for inter-comparison*

J. Sun, X. Xiong, and J. Butler, "NPP VIIRS on-orbit calibration and characterization using the moon", Proc. SPIE, 8510,85101I, (2012).
*X. Xiong, J. Sun, J. Fulbright, Z. Wang, and J. Butler, "Lunar Calibration and Performance for S-NPP VIIRS reflective Solar Bands", IEEE Trans. Geosci. Remote Sens., **54**, 1052-1061, (2016).*
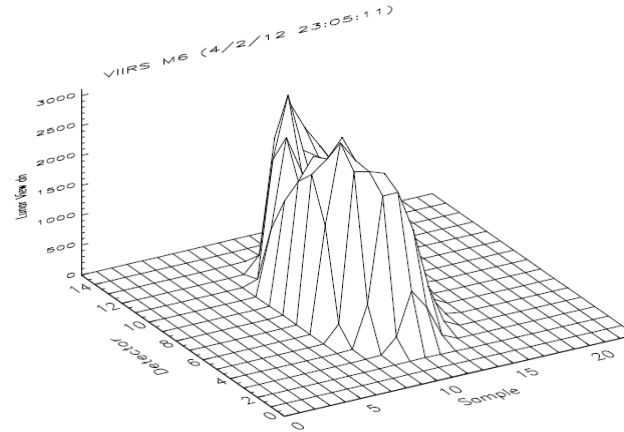

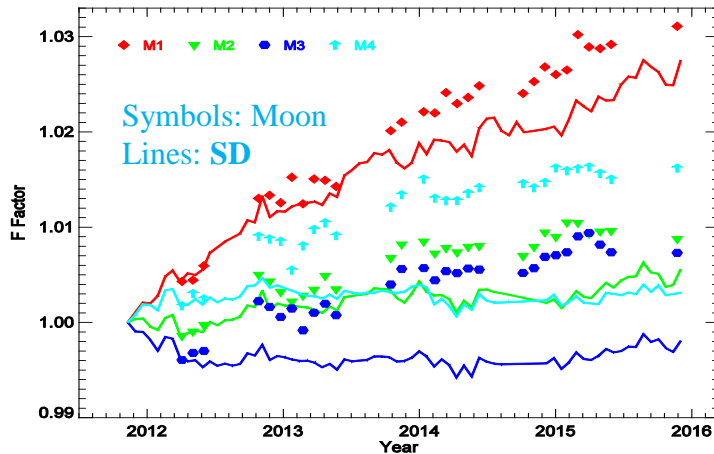

Lunar Planning and Calibration Results

Roll maneuver

Required roll maneuver
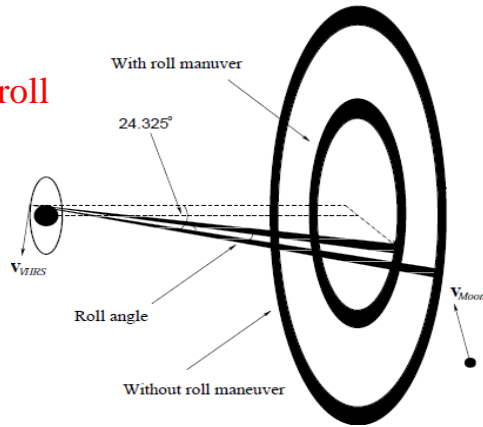

Lunar image (M6 in April, 2012)

Lunar and SD F Factors

Symbols: Moon
Lines: SD

- View geometry dependence
- ***Planning is important starting point – made lunar planning tool and planned lunar observations in early mission***
- However, the phase angle range change from [-56º, -55º] to [-50.5º, 51.5º]
- Size of the moon
- Oversampling effect
- Scans seeing full lunar image

*J. Sun and X. Xiong, "Solar and lunar observation planning for Earth-observing sensor", Proc. SPIE, **8176**, 817610, (2011).*

10

Hybrid Approach

- SD Calibration
  - SD degrades non-uniformly, resulting long-term drifts
  - Results are stable and smooth
  - Observation in every orbit

- Lunar Calibration
  - No degradation issue
  - Infrequent and no observation in three months every year

- Hybrid Approach

F-Factors Ratios are fitted to quadratic polynomials of time

$$\mathcal{F}(B,D,M,G) = R(B,t) \cdot F(B,D,M,G)$$

$$R(B,t) = \langle f(B,M,t) \rangle_M / \langle F(B,D,M,0,t) \rangle_{D,t-15<t_i<t+15,M}$$

  - **Lunar calibration provides long-term baseline**
  - **SD calibration provides smoothness and frequency**

Calibration Coefficients

Improvements in SDR

VIIRS M1 vs MODIS B8

VIIRS M4 vs MODIS B4

Poster: "Radiometric Comparison of the RSBs of the SNPP VIIRS and Aqua MODIS through SNO analysis" by M. Chu, J. Sun and M. Wang.

Desert Sites   M1

1% drift VIIRS M1 (SD-based calibration baseline)

A. Wu et al., "Assessment of SNPP VIIRS VIS/NIR Radiometric Calibration Stability Using Aqua MODIS and Invariant Surface Targets", IEEE TGRS, 54, 2918-2924, 2016.

- **Hybrid-method corrected M4 is clearly better**

- **Uncorrected M1 desert trending shows 1% drift (NASA reprocessed VIIRS SDR with SD-based calibration baseline)**

- **Hybrid-method corrected M1 SDR removes the 1% drift**

- **Aqua MODIS Band 8 has long-term drift**

Improvements in Ocean Color Products

- VIIRS data were reprocessed using **MSL12** with SDR generated with updated hybrid calibration coefficients.

- NOAA ocean color products produced with the hybrid calibration coefficients have met validated maturity in March 2015.

- **Hybrid results agree with MOBY in situ!**
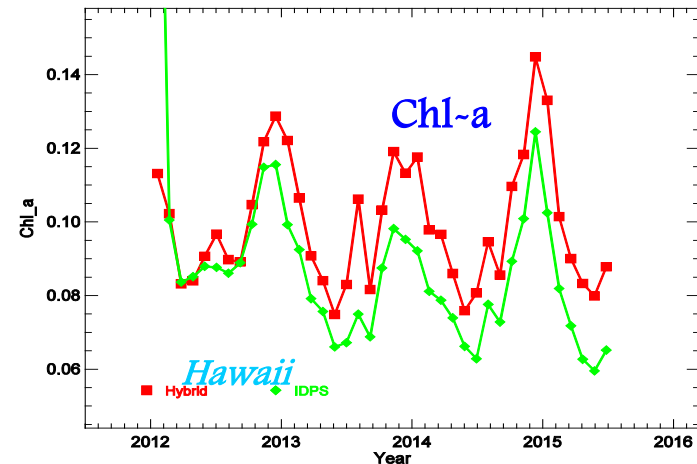

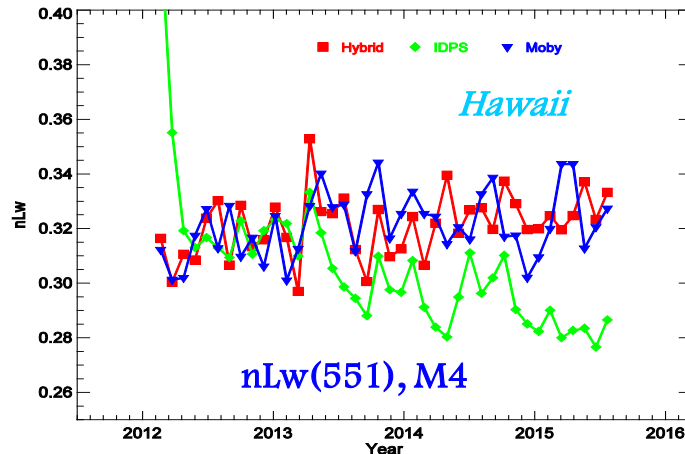

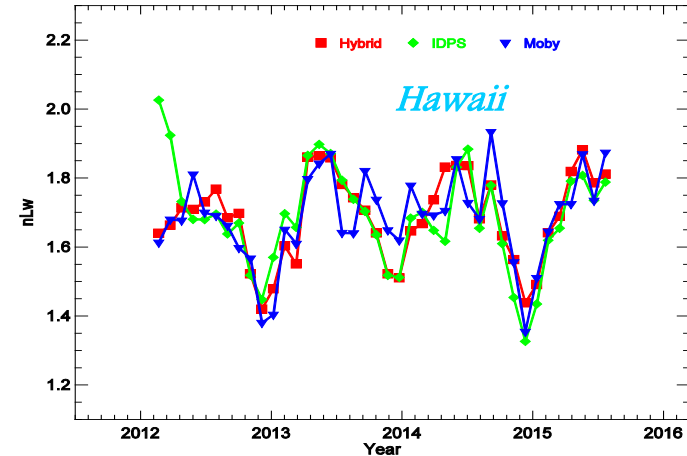

Green: VIIRS IDPS; Red: VIIRS Hybrid; Blue: Moby in Situ

14

Some Other Challenges

- SD degrades abnormally

Unexpected but real degradation (Nov., 2014)

- S-NPP orbit drift

Azimuth angle in instrument coordinate system

- RVS may change on-orbit
  - Aqua and Terra MODIS RVS have changed more than 20% and 40%, respectively, at small AOI.

- *J. Sun, X. Xiong, A. Angal, H. Chen, A. Wu, and X. Geng, "Time dependent response versus scan angle for MODIS reflective solar bands," IEEE Trans. Geosci. Remote Sens., 52, 3159-3174 (2014).*
- *J. Sun and X. Xiong, "MODIS polarization sensitivity analysis", IEEE Trans. Geosci. Remote Sens., 45, 2875-2885 (2007).*

- Polarization sensitivity may change on-orbit
  - Terra MODIS polarization sensitivity changed dramatically on-orbit

Summary

- RSB calibration is demanding, and especially so for the very stringent ocean color product requirements. Every component must be rigorously examined.

- Robust characterizations of essential calibration components have been completed, achieving accurate reprocessed ocean color EDR and becoming routine for forwarding science quality products

- "*Solar diffuser degradation nonuniformity effect*" will be a key issue for all instruments such as VIIRS J1, VIIRS J2, etc., that use SD/SDSM for reflective solar bands calibration - hybrid-method mitigation will be vital.

- There will be more challenging and non-trivial problems when the instrument begins to age.
